

**Statement of Jacqueline Gillan
Vice-President Advocates for Highway and Auto Safety
On U.S./Mexican Trucking: Safety and the Cross Border Demonstration Project**

**Before the
Subcommittee on Highways and Transit
House Transportation and Infrastructure Committee
United States House of Representatives
Washington, D.C.**

March 13, 2007

I. Introduction.

Good morning. I am Jackie Gillan, Vice-President of Advocates for Highway and Auto Safety. I wish to commend the Subcommittee on Highways and Transit for scheduling this hearing and continuing its careful oversight and scrutiny of the safety issues involved in opening the Southern U.S. border to interstate and foreign truck commerce throughout the United States.

I also appreciate the opportunity that you have provided me to list the reasons why the recently announced border “pilot program” is an exceptionally unwise and unauthorized public safety policy. Because only one witness representing the views of highway and truck safety groups was asked to testify, I wish to state that all of the preeminent truck safety groups that have been at the forefront of federal and state legislative initiatives to prevent truck crash deaths and injuries, including Public Citizen, Citizens for Reliable and Safe Highways (CRASH) and Parents Against Tired Truckers (P.A.T.T.), support the views expressed in my statement concerning opening the Southern border under the guise of a pilot program.

Let me begin by stating for the record that the Federal Motor Carrier Safety Administration (FMCSA), the agency within the U.S. Department of Transportation (DOT) responsible for overseeing motor carrier safety in the U.S. – including trucks crossing over the Southern border – is just not up to the job. I have been involved in truck safety issues for over 15 years and worked with Democratic and Republican Members of Congress in helping to craft the legislation that created FMCSA in 1999. The agency has never met any of its safety goals, even after weakening them repeatedly these past seven years, has had major safety regulations unanimously overturned by the courts, has ignored Congressional direction to advance and improve safety and completely ignores its statutory mandate to make safety its highest priority. For the record, I would like to submit investigative research articles written in 2006 from two leading newspapers, *The New York Times* and *The Dallas Morning News*, reporting on serious and chronic problems with the agency’s programs and policies that put trucking interests first and the safety of the American public last. I would also like to submit for

the record a list containing several Congressional safety mandates that FMCSA has ignored for many years.

I believe one of the best responses to the Administration's announcement to open the Southern border was contained in an Associated Press article published on February 23, 2007. "National Transportation Safety Board (NTSB) member Debbie Hersman questioned how the U.S. could spare sending inspectors to Mexico when only a tiny percentage of the hundreds of thousands of U.S. truck companies are inspected every year. 'They lack the inspectors to conduct safety reviews of at-risk domestic carriers,' Hersman said. 'That situation only gets worse if resources are diverted to the border.' " The NTSB also just scathingly criticized FMCSA for its extraordinarily poor record of safety enforcement and oversight in the February 21, 2007, hearing on the horrific fire and consequent deaths of residents at an assisted living facility in Texas who were fleeing the approach of hurricane Rita in a hired motorcoach. When it comes to ensuring the safety of commercial vehicles on U.S. highways, FMCSA's record over the past seven years is as dismal as that of the Federal Emergency Management Agency (FEMA) response to hurricane Katrina.

II. The Proposed New Pilot Program.

At the outset, the DOT's recent announcement appears to be a calculated, cynical move intended to ensure that the border is open to all commercial traffic regardless of the implications for highway safety. The proposed pilot program ignores the fact that federal law prohibits any vehicle from crossing the border until all safety requirements in Section 350 of the Department of Transportation and Related Agencies Appropriations Act for Fiscal Year 2002 (2002 U.S. DOT Appropriations Act), P.L. 107-87, are fully completed. Section 350 makes no exceptions for compliance with all elements of its requirements in subsections (a), (b) and (c). These obligations must be fully complied with before ANY truck is permitted to cross the border. What Secretary Peters proposes is to comply with some parts of Section 350 and assert that the border can be open in a piecemeal fashion. Her proposal does not comport with the law.

The announcement of the pilot program on February 23, 2007, was accompanied by little specific information about the requirements participating motor carriers and drivers would have to meet. There were absolutely no details or information about the pilot program plan, the study hypothesis, the criteria for selecting participating carriers, how and what data would be collected, what would constitute a justified finding from the data for making any safety determinations, the criteria for terminating participants, what objective measures would be used to determine successful completion of the pilot program, and whether there would be any independent oversight of the program. Even at the Senate Committee on Appropriations hearing on this matter, before the subcommittee on Transportation, HUD and Related Agencies, held last Thursday, March 8, 2007, Secretary of Transportation Peters was unable to clarify essential details on any of these issues other than to state that there would be two oversight committees of unknown membership since few if any people had agreed to serve on those committees. It is clear that despite more than two years of work to develop a NAFTA trucking pilot program

(according to the DOT Cross Border Truck Safety Inspection Program fact sheet on the DOT website), not even the most basic organizational planning and preparation to conduct a scientific and objective test for opening the southern border was invested in this pilot program prior to its announcement just over two weeks ago.

The lack of information and transparency on this pilot program is also reflected in FMCSA's failure to respond to a request for records Advocates filed under the Freedom of Information Act (FOIA). Although federal law requires a release of records within 20 working days, no records have been released even though over four months have elapsed since the FOIA request was filed on October 17, 2006. It appears to be no coincidence that Advocates' FOIA request has been stonewalled as DOT prepared in stealth to announce its pilot program.

Furthermore, neither in the announcement of the pilot program nor in the testimony of Secretary Peters in the Senate was there any mention that the pilot program would comply with the safety and procedural requirements of Section 4007 of Transportation Equity Act for the Twenty-First Century (TEA-21), Pub. L. 105-178 (1998), codified at 49 U.S.C. § 31315(c). That law provides the template that DOT must follow for pilot programs that test innovative approaches to motor carrier, commercial motor vehicle and driver safety. This novel attempt to experiment with safety on U.S. highways, if permissible at all, certainly falls within the ambit of the pilot program statute.

It is no coincidence that the Secretary of Transportation announced a limited pilot program that includes just 100 Mexico-domiciled trucking companies and a test period that will conclude in just 12 months. This select group of motor carriers almost certainly will not be representative of all Mexico-domiciled companies, vehicles and drivers that will be allowed across the border once the pilot program is completed and prematurely declared a "success."

In addition, the abbreviated 12-month duration of the pilot program is shorter than any previously considered or authorized FMCSA pilot program and only one-third of the three-year maximum time limit allotted by Congress for such programs in current law. As a result, there is no possibility that this pilot program will achieve the goal of collecting sufficient safety data to allow for accurate and reliable analysis of the safety issues at stake.

This pilot program is intended to serve as a show-piece under NAFTA in order to permit the Secretary to proclaim victory and declare the entire Southern border open to unfettered long-haul truck commerce before the end of 2008. In order to serve the public properly and protect safety, we must deal realistically with the many safety issues that are yet to be resolved before the border is in fact ready to be opened to all commercial vehicles.

III. Summary of Recommended Actions.

Mister Chairman, opening the Southern border for NAFTA trucks is akin to a perfect storm. It is a predictable disaster. The U.S. agency responsible for overseeing the public safety for large trucks, FMCSA, is incompetent. The staff administering the law is largely indifferent and regularly ignores its statutory responsibilities. The trucking regime in Mexico is not ready for safe entry onto U.S. highways. Too often in the last few years we have seen this deadly combination fail the American public, as in the hurricane Katrina and the Walter Reed Hospital debacles. And we have seen that once we embark on a course of action, it is impossible to take it back. My testimony today will address these issues in great detail. We urge the Subcommittee to stop the border from being opened.

It is clear that the enactment of the Murray/Shelby language in Section 350, of the 2002 U.S. DOT Appropriations Act, has fostered long overdue changes and improvements in FMCSA's activities. Nevertheless, the border is still not ready to be opened for NAFTA truck travel throughout the U.S. Let me be clear: we do not call for a permanent ban on NAFTA commercial traffic at the southern border. But until we are certain that everything has been done to ensure public safety, the border should remain closed to long-haul interstate traffic. Permitting this pilot program to proceed before the border is actually ready to be opened could be disastrous. For that reason, this Committee needs to step in on behalf of the public.

I will briefly summarize the actions that still need to be taken to protect public safety at the border.

- ▶ Do not allow the ruse of a fake pilot program to be used to justify opening the border.
- ▶ Ensure that all Section 350 requirements, including section (a), (b) and (c) as the law commands, have been fully completed before any truck is permitted to cross the border, including that:
 - Security issues for hazmat operations have been satisfactorily resolved;
 - Sufficient inspection resources are available at all designated border crossing points for verifying bus driver commercial licenses and Commercial Vehicle Safety Alliance (CVSA) decals;
 - Alcohol and drug testing regimes are fully compliant;
 - All data requirements are fully compliant;
 - Truck inspection facilities are capable of requiring Level 1 inspections in close proximity to each border crossing where trucks are allowed.
- ▶ Ensure that DOT complies with Section 4007 governing the conduct of pilot programs.
- ▶ Require DOT to document that every state will actually enforce state laws to issue out of service orders to foreign vehicles that do not have proper operating authority.
- ▶ Provide that certification of compliance with U.S. safety standards is enforced for all commercial vehicles.
- ▶ Require NTSB investigations of fatal or injury-producing crashes involving cross-border trucks.

- ▶ Require that commercial vehicles entering the U.S. are equipped with electronic on-board recorders to document hours of service.
- ▶ Require DOT to respond to outstanding FOIA requests on these issues in full, with no withholding of any records.

IV. Background: The Border Zone and NAFTA.

In the Bus Regulatory Reform Act of 1982, Pub. L. 97-261 (1982), Congress imposed a legislative moratorium on granting operating authority to both Mexican and Canadian motor carriers seeking to operate in the U.S. but provided for Presidential modification of the moratorium. Although the moratorium was lifted almost immediately for Canada-domiciled motor carriers, it remains in effect for Mexico-domiciled motor carriers. Currently, Mexico-domiciled motor carriers operate mainly in a narrow strip called a commercial zone along the Southern borders of the four southwestern states contiguous with Mexico. The “border zones” in California, Arizona, New Mexico and Texas vary in size between three and 20 miles inland from the U.S. border.

In December 1992, Canada, Mexico and the U.S. signed the North American Free Trade Agreement (NAFTA). NAFTA required the governments to reduce trade barriers and promote open, unfettered trade across all three countries, including free movement of commercial motor vehicles transporting freight and passengers. NAFTA also sought to harmonize differing laws, policies and regulations governing major areas of trade, although each country was permitted to maintain its regulations regarding health, safety and environmental protection. NAFTA was invoked immediately as the justification for eliminating the Southern border operating restrictions on Mexico-domiciled motor carriers and allowing them unfettered access to the remainder of the U.S., as well as intercontinental access to Canada, as long as U.S. requirements for truck and bus safety design, commercial motor vehicle freight (including hazmat) and passenger operations, and driver qualifications were adhered to.

NAFTA required complete border opening to commercial traffic by December 18, 1995, even though no assessment had been made about the safety consequences. However, on that same day, the President postponed implementation of NAFTA cross-border interstate trucking privileges for Mexico-domiciled motor carriers based on concerns both for highway safety and environmental issues involving diesel emissions. The U.S. DOT Secretary subsequently announced that Mexico-domiciled trucks would continue to have access only to the four southwestern states’ commercial zones until U.S. safety and security concerns were satisfactorily addressed.

Oversight investigations and reports conducted by U.S. government agencies in the 1990s painted a dismal picture both of Mexico-domiciled motor carrier safety and of the poor quality of preparation and level of readiness of U.S. federal and state enforcement officials to handle the potential number of Mexico-domiciled trucking and bus companies that might apply for operating authority to transport freight and passengers throughout the U.S. and into Canada. These and other concerns about commercial motor vehicle safety at the Southern border prompted Congress to take action

to respond to the shortage of resources and programs to provide for adequate inspection of Mexico-domiciled commercial motor vehicles and oversee safety compliance with U.S. laws and regulations. The 1998 Transportation Equity Act for the 21st Century (TEA-21), Pub. L. 105-178, responded to the poor inspection effort at the U.S.-Mexico border by allowing up to five percent of Motor Carrier Safety Assistance Program (MCSAP) funds to be directed to border enforcement efforts, and by requiring the Secretary of Transportation to review the qualifications of foreign motor carriers seeking operating authority in the U.S.

Following enactment of TEA-21, however, government studies continued to find violations by Mexico-domiciled motor carriers, including widespread violations of registration, identification numbers, illegal operation beyond the commercial zones in the border states, and also showed multiple, serious safety violations such as no licenses, no medical certificates, no logbooks and noncompliant safety equipment.

Nevertheless, after a NAFTA tribunal ordered the U.S. to open the border for commercial motor vehicles or face permanent trade sanctions, in February 2001, the U.S. stated that it would comply with its NAFTA obligations and allow Mexico-domiciled motor carriers to operate beyond the commercial zones by January 2002. In clarifying the action, the Secretary of Transportation stated that “. . . every Mexican firm, vehicle and driver that seeks authority to operate in the U.S. – at the border or beyond – must meet the identical safety and operating standards that apply to U.S. and Canadian carriers.” Testimony of Secretary of Transportation Norman Y. Mineta before the Senate Commerce, Science and Transportation Committee (July 18, 2001).

The concern in Congress over motor carrier safety at the Southern border continued to mount as a result of oversight reports by the DOT Office of Inspector General (IG) and the Government Accountability Office (GAO), along with independent assessments by national safety organizations, documenting the poor and often belated administrative response of the DOT to the growing number of Mexico-domiciled motor carriers seeking entry at the Southern border. These oversight findings showed that the agency’s plan for conducting a safety application and monitoring system was highly inadequate. Congressional concern resulted in passage of the Murray/Shelby Amendment, Section 350 of the 2002 DOT Appropriations Act. That provision, which was developed in this committee, imposed numerous highly specific safety requirements and processes that FMCSA had to comply with prior to permitting any Mexico-domiciled motor carrier to operate beyond the border zones. A litany of provisions and preconditions to the opening of the border that is, I dare say, well known to the members of this Subcommittee, addresses many, but not all, of the safety concerns at the border.

That legislation also gave the DOT IG a major oversight role in verifying that certain preconditions to Mexican long-haul truck commerce were fulfilled. Carrying out that responsibility has involved a series of follow-up audit reports because, as of January 2005, the date of the last such audit, the IG could not verify that DOT had in all respects completed the full slate of requirements in Section 350. A further IG audit report is expected in a few weeks. I find it shocking that despite the importance of this action and

the key role of the IG in the process, the DOT decided to open the border on February 22, 2007, shortly before the next IG report is to be submitted to Congress.

V. Section 350 Has Been Essential in Advancing Motor Carrier Safety.

It is indeed fortunate that the circumstances of this precipitous decision to begin opening the border have been controlled by the foresight and wisdom of this Committee. The prudent action of the Senate Committee on Appropriations, which inserted Section 350 into the 2002 DOT Appropriations Act, resulted in detailed requirements for U.S. DOT compliance, including oversight and corroboration of key features of border safety preparedness by the DOT IG's office. Without that crucial legislative action, there would have been a very different outcome in recent years to the safety of cross-border truck and bus operations by Mexico-domiciled motor carriers.

The detailed requirements of Section 350 impose preconditions to opening the border and govern the verification of numerous safety requirements controlling the potential operation of long-haul commerce in the U.S. by Mexico-domiciled motor carriers. In addition, Section 350 also applies to the safety quality of the short-haul drayage operations confined to the Southern commercial zones. There should be no doubt that, without the important safety controls of Section 350, the Southern border would already have been opened without the safeguards called for in the legislation. Without Section 350, much more dangerous trucks and buses would have crossed into the U.S. and operated freely on all of our highways, and the losses of lives and the injuries inflicted by such a foolhardy decision would have mounted month by month in state after state.

By its very terms, Section 350 includes two types of benchmarks. First, all of the substantive provisions of section 350(a) must be completely fulfilled in all respects before the Secretary of Transportation can review or process an application by a Mexico-domiciled motor carrier for authority to operate beyond the U.S. commercial zones. Second, all substantive requirements of section 350(b) and (c) must be fully completed before a single vehicle (truck or bus) owned or leased by a Mexico-domiciled motor carrier is permitted to operate beyond the U.S. commercial zones. The terms of the statute are unequivocal and only the completion of all those pre-conditions will satisfy the legal requirements of Section 350.

The enlightened safety approach of Section 350, however, does not exhaust the important safety issues relevant to the opening of the border. Beyond the four corners of Section 350 there are a number of other serious, real-world concerns that must be addressed and that preempt any "pilot program" attempt to short circuit border safety.

VI. Mexico-Domiciled Motor Carrier Safety Is Still Dangerously Deficient.

As you know, the Secretary certified on November 20, 2002, that authorizing Mexico-domiciled motor carrier operations in the U.S. did not pose an unacceptable safety risk. That certification certainly should not have been made with the facts then

before the Secretary. At the time of the certification, the results of U.S. inspections and of the very few compliance reviews that had been conducted portrayed a horrific record of poor safety compliance by Mexico-domiciled trucks and buses conducting operations in the Southern commercial zones. Drivers from Mexico were regularly found without valid Mexican commercial driver licenses, a wide range of hazardous materials (hazmat) violations were constantly cited, Mexico-domiciled trucks and buses were crossing our Southern border into the U.S. at illegal points of entry, and trucks and buses from Mexico had consistently high rates of equipment defects such as bad tires and inoperative brakes. This raises a concern regarding the sufficiency of the certification issued by the Secretary and whether it was intended to evade the Congressional intent behind Section 350 by sacrificing safety for expediency.

The current status of cross-border trucking operations by Mexico-domiciled carriers is still alarming. Drivers coming into the U.S. from Mexico still have high rates of violations. For example, the FMCSA's "NAFTA Safety Stats" on its Analysis and Information Web site shows that for 2005, the latest year that figures are posted, 21.5 percent of Mexico-domiciled commercial motor vehicles were placed out of service for vehicle defects. Of these, fully 17.5 percent were found to have their brakes out of adjustment. Bad brakes on Mexico-domiciled trucks and buses have been a chronic border safety problem for years.

Similarly, when drivers cross over into the U.S. in trucks and buses from Mexico, over 15 percent do not even have any paper logbooks when they are asked for their records of duty status (RODS), and almost one in four drivers does not even have their own country's commercial driver license, the Licencia Federal de Conductor. In addition, one out of every 10 drivers from Mexico does not even have the proper license for the type of commercial motor vehicle they are driving. As for hazmat being hauled into the U.S., a very frightening aspect of cross-border trade for both safety and security concerns, nearly 22 percent of the vehicles transporting hazmat used prohibited placards in 2005 for identifying the nature of the dangerous cargo that was being hauled across the border, more than three times the rate for U.S. motor carriers hauling hazmat.

VII. FMCSA Has a Poor Record of Ensuring the Safety of All Truck and Bus Operations in the U.S., Including Mexico-Domiciled Motor Carriers in the Border Zone.

On the basis of this ongoing poor safety record of border-zone operations by Mexico-domiciled motor carriers, the U.S. DOT asks that we nevertheless suspend belief and good judgment and accept on faith that the trucking companies from Mexico hand-picked to participate in the so-called "pilot program" will be radically different in the safety of their operations and management. This, of course, contradicts the design of a true pilot program. DOT has implied that it will maintain intensive oversight of the companies selected to conduct U.S. long-haul operations.

This claim starkly contrasts with the poor record of FMCSA oversight of domestic motor carrier operations and the current Mexico-domiciled commercial zone

trucking operations. There were 14,000 active motor carriers domiciled in Mexico conducting operations in the U.S. in 2005. However, only 106 compliance reviews were conducted on Mexico-domiciled motor carriers that year, and that figure represents a decline from 236 in 2004 and 268 in 2003. The most intensive safety evaluation of a motor carrier, the compliance review, has slipped **by more than 60 percent in only two years**. The 2005 figure represents a comprehensive safety evaluation of **only three-quarters of one percent (0.75%)** of Mexico-domiciled motor carriers operating in the U.S. border zone. This is an even poorer oversight record than FMCSA's recently criticized failure by the members of the National Transportation Safety Board at a public hearing on February 21, 2007. Members of NTSB criticized FMCSA for conducting severely inadequate numbers of compliance reviews for domestic carriers, only about 1.5 percent each year. Even at its height in 2003, the best year for the agency and its state partners in conducting compliance reviews on Mexico-domiciled motor carriers, **less than two percent were performed**.

The agency estimates that there were 4,575,887 crossings into the U.S. through the 24 recognized ports of entry by Mexico-domiciled motor carriers operating 41,101 power units (tractors) that engage in millions of trailer movements. But only 180,061 inspections on these carriers' tractors and trailers were performed in 2005. And that disappointing number of inspections resulted in 21.3 percent of the vehicles being placed out of service for non-compliance with the Federal Motor Carrier Safety Regulations. This exceptionally poor inspection record does not encourage an optimistic view that FMCSA will inspect vehicles operated by long-haul carriers participating in the pilot program.

This meager oversight performance by FMCSA does not augur well for placing any trust in DOT's assurances that the participants in the pilot program will be closely scrutinized for their safety performance. Even if they are, that closer scrutiny could come at the expense of even further declines in FMCSA's safety evaluation of border-zone-only Mexico-domiciled motor carriers. It has to be stressed that the agency has taken on new responsibilities in recent years that further dilute its resources, such as performing safety audits on approximately 48,000 new entrant domestic motor carriers. So it is clear that FMCSA overwhelmingly puts its faith in controlling the safety of border-zone-only Mexico-domiciled carriers with federal and state roadside inspections. The agency is doing almost nothing to evaluate the safety management controls, drivers and equipment of these carriers operating in the Southern commercial zones by use of its most intensive safety evaluation, the compliance reviews. And it never has.

None of the figures that I have cited from FMCSA's own data reassures us that DOT is on the job ensuring that Mexico-domiciled motor carrier safety is being dramatically improved. Yet, against this backdrop of poor safety performance and meager oversight efforts, DOT now wants to find a way to justify opening our borders not just to limited operations in a narrow swath of roads in the four Southern border states, but also to long-haul foreign commerce traveling throughout the U.S.

VIII. Several Major Areas of Mexico-Domiciled Motor Carrier Safety and Oversight Remain Seriously Defective and Jeopardize Safety for Everyone.

a. The States Are Not Stopping Border-Zone-Only Mexico-Domiciled Motor Carriers from Operating throughout the United States.

Current information shows that many states still are not ready to deal with truck commerce coming from Mexico. Dozens of states are still not placing Mexico-domiciled trucks and buses out of service when they are found to be operating illegally beyond the Southern commercial zones. While all states may now have in place the legal basis for placing Mexico-domiciled vehicles out of service that do not have operating authority, as required by Section 350(a), many states are not exercising that authority through enforcement actions. This undermines the safety goals Congress intended to achieve in passing Section 350.

Although FMCSA issued an interim final rule in August 2002 requiring state inspectors to place out of service any commercial vehicles operating without authority or carrying cargo or passengers beyond the scope of their authority, the fact is that about half the states are apparently not actually using their new authority to place Mexico-domiciled motor carrier trucks and buses out of service if they are found with illegal operating authority. [67 FR 55162 (Aug. 28, 2002).] When the DOT IG issued the last audit of cross-border motor carrier safety, the report emphasized that the states were apparently not even placing border-zone-only trucks and buses from Mexico out of service when they were found to be operating beyond the commercial zones. “Section 350 requires that measures are in place to ensure that effective enforcement actions can be taken against Mexican motor carriers. This includes taking action against Mexican carriers that do not have proper operating authority.” [*Follow-Up Audit of the Implementation of the North American Free Trade Agreement’s (NAFTA) Cross Border Trucking Provisions – Federal Motor Carrier Safety Administration*, Report Number MH-2005-032, Office of the Inspector General, United States Department of Transportation, January 3, 2005.]

If many states are still not actually stopping domestic trucks and buses that don’t have valid registrations from operating, it is certain that many of those states are not actually placing foreign motor carriers out of service if they are found to be operating beyond the scope of their legal authority. The DOT IG in the latest published report on the Southern border, *op. cit.*, dated January 2005, pointed out that, despite confirming that all states were equipped with the authority to place carriers out of service that are found to be operating with invalid authority from FMCSA, only four of 14 states interviewed in 2004 by the staff of the DOT IG were found to be actually placing Mexico-domiciled trucks and buses out of service because of a determination of illegal operating authority.

Over two years later, there seems to have been no improvement. Poor state enforcement practices for Mexico-domiciled motor carriers found without proper operating authority remains an unresolved issue.

In his testimony before the Subcommittee on Transportation, HUD, and Related Agencies of the Senate Committee on Appropriations, delivered on March 8, 2007, it is apparent that the IG still has no confirmation that all the states are actually stopping trucks and buses from Mexico operating either without any legal authority or operating beyond the scope of their border-zone-only legal authority. The IG testified only that all states now have a rule in place allowing them to stop trucks and buses from Mexico from continuing to operate if they have illegal operating authority. He did not assert that this rule is actually being used all over the U.S. to enforce operating authority violations. In fact, the IG points out that some states' officials didn't even know how to find out from FMCSA whether a foreign motor carrier had legal operating authority and others did not have the communications equipment available to contact FMCSA to make such an inquiry. The uncertainty in the IG's testimony clearly led him then to state that he will continue to monitor this issue.

It should be apparent to the committee that Mexico-domiciled motor carriers are not being inspected often enough, they receive few compliance reviews each year, the vehicles have high rates of crucial safety equipment defects such as brake misadjustment, drivers often are without logbooks for hours of service compliance or their own national drivers' license, and the states do not appear to be putting them out of service and preventing them from operating when they exceed their authority to operate beyond the border zone. It is against this backdrop of poor safety performance and poor federal and state oversight that DOT proposes to advance a pilot program to allow up to 100 Mexico-domiciled trucking companies to haul freight throughout the U.S. It is inconceivable that a similar pilot program would ever be proposed by the U.S. DOT to accommodate foreign airlines seeking to operate in this country if the same safety flaws and failings existed. There would be a deafening outcry in Congress and by the public if such an ill-advised and dangerous proposal were suggested by the Administration.

b. Additional Safety Problems with Mexico-Domiciled Motor Carriers.

As the committee is well aware, Section 350 set forth numerous requirements for fulfillment by the U.S. DOT and for oversight and verification of completion by the Inspector General. The January 2005 IG report listed several major items that were unfinished or inadequate and still needed to be addressed by FMCSA. First and foremost, our motor carrier safety personnel from FMCSA must be allowed to conduct on-site safety audits at each Mexico-domiciled motor carrier's place of business to assess its management controls, equipment safety, and driver qualifications. Next, Section 350 requires that a full compliance review must be performed before a carrier may be given permanent operating authority for long-haul commerce in the U.S. To the best of our knowledge, no safety audits yet have been performed and, of course, no compliance reviews have been conducted determining that Mexico-domiciled trucks are safe enough to have permanent registration.

I am not going to recite every Section 350 requirement for the committee this morning. However, I want to emphasize that there are serious concerns about several

items in the long roster of Section 350 requirements and allied issues that must be resolved before the border can be opened to even limited long-haul commerce from Mexico.

Information about Convictions and License Suspensions and Revocations of Drivers from Mexico Is Unreliable

A major issue of concern is the quality of the data transmitted to FMCSA by the states concerning driver records. In the January 2005 audit report on Mexico-domiciled motor carriers, the IG pointed out that data from the states were lacking on driver convictions and license suspensions of truck and bus operators from Mexico.

Serious Questions on Drug and Alcohol Testing and Medical Examinations/Physical Fitness of Drivers from Mexico Are Not Resolved

Issues regarding drug and alcohol testing and the physical fitness and medical standards applied to truck and bus drivers in Mexico as a condition of commercial driver licensure also remain active concerns. It appears as though the issue of drug and alcohol testing has not been resolved.

Section 350 requires documented proof that all cross-border foreign drivers are complying with all of the U.S. commercial driver requirements for drug and alcohol testing. This is particularly important for Licencia Federal de Conductor drivers who are providing samples in Mexico and then sending them to U.S. labs for evaluation. The Inspector General stated in the January 2005 report that collection facilities and procedures in Mexico are not certified. This means that the security of the samples is unknown. Let me emphasize again to the committee that this is a major safety concern for all cross-border operations by Mexico-domiciled motor carriers, not just those few companies that are carefully selected to participate in a "pilot program." Even if the select group of trucking companies from Mexico has all drivers tested at approved U.S. drug and alcohol testing facilities, that does not signify completion of the pre-conditions of Section 350 or guarantee that all drivers crossing the border after the pilot program ends and the border is opened will be subject to U.S. drug and alcohol testing requirements.

In addition to the issues that are specifically relevant to Section 350, the safety community has serious concerns about the medical standards and physical fitness requirements for Licencia Federal de Conductor holders. It is well-known and recently acknowledged by both FMCSA and the states in a pending rulemaking action integrating the Commercial Driver License (CDL) with the federally required medical certificate that commercial drivers "doctor-shop" to find health care providers that will find them physically fit to operate a commercial motor vehicle in interstate commerce. 71 FR 66723 (Nov. 16, 2006). In fact, thousands of these drivers have disqualifying medical conditions that would prevent the person conducting the physical examination from signing off on the required medical certificate. Some of the disqualifying medical conditions listed in FMCSA's regulations are unquestionably major threats to public safety if a commercial driver operates a big rig or a motorcoach with these diseases or impairments.

The safety community is also deeply concerned over the quality of the medical examination and physical fitness requirements and process in Mexico for all Licencia Federal de Conductor holders operating in the U.S. Although this was not a specific, itemized requirement of Section 350, it has become a growing concern with the gradual realization over the past few years that fraudulent and invalid medical certification among even U.S. commercial drivers is a pervasive, chronic problem that FMCSA is just beginning to attempt to curtail at the strong urging of the National Transportation Safety Board. I ask the committee specifically to investigate this issue for all cross-border bus, motorcoach, and truck operations conducted by Licencia Federal de Conductor holders in the U.S. We believe that there may be a similar problem in Mexico of drivers finding ways around medical examinations and fitness requirements for commercial licensure. If so, this threatens public safety here in the U.S.

Excluding Hazardous Materials, Bus Long-Haul Operations Violates Section 350

Apparently, DOT is not contemplating long-haul commerce in the U.S. either by Mexico-domiciled hazardous materials (hazmat) haulers or by bus or motorcoach companies immediately, but has not foreclosed such cross-border transportation in the future. Security issues for hazmat operations throughout the U.S. have not been satisfactorily resolved by the Transportation Security Administration. As for buses and motorcoaches coming into the U.S. from Mexico, the DOT IG's January 2005 report found that sufficient inspection resources are not available at all designated border crossing points for verifying bus driver commercial licenses and for inspecting buses that have expired Commercial Vehicle Safety Alliance decals. It appears that, as of March 2007, those inadequate bus inspection procedures had still not been corrected. The failure to address and complete these issues as required by Section 350 presents a legal prohibition that DOT cannot evade by excluding hazmat operators and buses from the pilot program. Section 350 expressly states that "[n]o vehicles owned or leased by a Mexican motor carrier may be permitted to operate beyond" the commercial zones until all pre-conditions have been met. There is no exception for vehicles of motor carriers that participate in a supposed pilot program.

FMCSA Relies on Poor Data and a Defective Procedure for Identifying High-Risk Motor Carriers

The next issue that needs to be addressed is the chronic problem of the poor quality data supplied to FMCSA that it relies on to monitor commercial motor vehicle and motor carrier safety. The DOT IG and the GAO, in separate reports over the past several years, including reports in 2004 and 2005, emphasized the unreliability of the safety data on motor carriers that FMCSA uses to operate its safety scoring algorithm, the Safety Status Measurement System, or SafeStat as it is commonly referred to.

The GAO report found that one-third of commercial vehicle crashes that the states are required to report to FMCSA were not reported, and those crashes that were reported were not always accurate, timely or consistent. *Highway Safety: Further Opportunities Exist to Improve Data on Crashes Involving Commercial Motor Vehicles*, GAO-06-102 (Nov. 18, 2005). Three years ago, following a DOT Inspector General report pointing

out how unreliable data were used by FMCSA, the agency removed the overall safety score for motor carriers from its Web site. *Improvements Needed in the Safety Status Measurement System*, Report Number MH-2004-034, Office of the Inspector General, United States Department of Transportation (Feb. 13, 2004). Those data are still missing from the agency's web site. In addition, the DOT IG found in that report that 50 percent of Mexico-domiciled motor carriers in the U.S. claimed that they had no tractor power units in operation.

The Inspector General issued yet another report on FMCSA data quality in April 2006. *Significant Improvements in Motor Carrier Safety Program since 1999 Act but Loopholes for Repeat Violators Need Closing*, OIG Report Number MH-2006-046 (Apr. 21, 2006). The audit found that data quality is still seriously defective and that it undermines several important areas of FMCSA enforcement and substantially reduces the effectiveness of SafeStat to identify high safety risk motor carriers. The DOT IG points out that, although FMCSA adopted a regulation a few years ago requiring registered motor carriers to update their registration every two years, 192,000, or 27 percent, of the registered 702,277 motor carriers did not update their census data on both drivers and trucks despite the requirement of the 2002 regulation. In addition, the report found that forms used by the states to report crash data to FMCSA still do not consistently define a large truck or a reportable crash, resulting in confusion. These failings continue to undermine the reliable data that FMCSA needs. The 2006 report also found that FMCSA, despite the previous February 2004 OIG oversight report, had not taken sufficient action to achieve full updates of motor carrier census data and standardize crash data requirements and collection procedures. Data quality is crucial because the combination of updated, timely census data and crash data is used by SafeStat to rank safety performance of motor carriers and target them for compliance reviews and inspections. The OIG stressed in this recent report that, without these critical data, FMCSA cannot accurately identify the high-risk motor carriers.

It remains to be seen what the DOT IG's next report, expected in less than two months, will find regarding the increased data quality and accuracy of SafeStat to identify risk-prone long-haul motor carriers operating throughout the U.S. The January 2005 report documented that *one-third* of the crashes that actually occurred were not reported to FMCSA from the states. The Inspector General's most recent findings also need to be matched against FMCSA's request for funding for FY2008 that, among other things, still acknowledges that inadequate data on motor carrier safety are being provided by the states because the submissions involve either under-reporting, mistaken data entries or late transmission to the agency.

It is doubtful that, even with timely, complete, accurate data reporting, FMCSA can identify the high-risk motor carriers. The other problem with the agency's safety monitoring system is the SafeStat system itself. This arcane method of scoring motor carrier safety has been repeatedly criticized, including by an Oak Ridge National Laboratory report on SafeStat. The Oak Ridge analysis showed that the basis of SafeStat ultimately is subjective, based upon expert consensus opinion or judgment, and therefore has no meaningful statistical relationship to the data used to operate the system's

algorithm for detecting high safety risk motor carriers. K. Campbell, R. Schmoyer, H. Hwang, *Review of the Motor Carrier Safety Status Measurement System*, Final Report, Prepared for the Federal Motor Carrier Safety Administration, Oak Ridge National Laboratory (Oct. 2004). As a result, SafeStat often tapped the wrong motor carriers as safety risks.

Safety organizations have also shown in comments to FMCSA rulemaking dockets that SafeStat is a bankrupt method of identifying dangerous motor carriers, particularly small motor carriers with only a few tractor power units. In addition, the algorithm incorporates a relativist, peer-to-peer safety rating system that has no independent, objective standards for motor carrier safety indexed to specific goals of reducing both the rate and the numbers of annual motor carrier fatalities. But, sad to say, these are the data and this is the system that DOT will rely on to monitor and gauge the safety of both long-haul and short-haul Mexico-domiciled motor carriers.

Prospects for Compliance with Hours of Service Limits Are Poor

Safety organizations are still not satisfied that DOT has a system that will prevent drivers coming into the U.S. from Mexico who are already fatigued and sleep-deprived and present a serious threat to highway safety. In addition, drivers in Mexico are not subject to separate hours of service restrictions specifically tailored for commercial drivers. Apparently, there is only a general working hours limit of eight hours per day that, as far as we can determine on the basis of anecdotal evidence, is not enforced.

Even if commercial drivers with Licencia Federal de Conductor operate in the U.S. within current hours of service limits, those limits are again under legal challenge. Among many other defects, FMCSA refuses to acknowledge that the dramatic increases in working and driving hours it forced on truck drivers in 2003, and again in 2005, inherently foster fatigue and sleep deprivation. Although the 2003 rule was overturned in a scathing opinion from the U.S. Court of Appeals for the District of Columbia Circuit in 2004 (*Public Citizen v. FMCSA*, 374 F.3d 1209 (D.C. Cir. 2004)), FMCSA was undeterred: It attempted to rehabilitate the same failed hours of service rule with some new rationalizations and reissued it in virtually the same form in 2005. That new regulation increases the working hours of a U.S. commercial driver by 40 percent over an eight-day tour of duty and driving hours by 28 percent over the same time span. Commercial drivers can now work 98 hours in eight days and drive 88 hours in eight days. Certain exemptions for short-haul operations in smaller trucks actually allow drivers to work over 100 hours in a week.

This is the so-called “safety” regime that drivers from Mexico will operate within, a regulation that actually fosters worn-out drivers pushed day after day to deliver loads under nightmare schedules forced on them by motor carrier officials and shippers.

The other major problem hobbling any meaningful compliance with U.S. hours of service limits, as liberal as they are, is FMCSA’s refusal to require electronic on-board recorders (EOBRs) to record the actual driving time of commercial operators. Despite the fact that the agency was required by Congress, in Section 408 of the Interstate

Commerce Commission Termination Act of 1995, Pub. L. 104-88 (1995), to address the problem of hours of service regulations by evaluating EOBRs, the agency procrastinated until it was compelled by the U.S. Court of Appeals for the District of Columbia Circuit in 2004 to adequately address the problem. The court acted because FMCSA had proposed adoption of EOBRs in the hours of service rulemaking proposal in 2000, 65 FR 25540 (May 2, 2000), but then had a change of heart after strong opposition from major sectors of the trucking industry. FMCSA terminated EOBR rulemaking in 2003 when it issued its first attempt at an amended hours of service regulation. 68 FR 22456 (Apr. 28, 2003). Even then, the agency responded with only an advance notice of proposed rulemaking in September 2004 instead of proposing a long overdue EOBR regulation. 69 FR 53386 (Sept. 1, 2004).

EOBRs are of pivotal importance in lessening the epidemic of hours of service violations in the trucking industry. Several studies and surveys conducted by independent researchers, the Insurance Institute for Highway Safety and the University of Michigan for FMCSA's 2000 rulemaking proposal to amend the hours of service rule have shown repeatedly over many years that hours of service violations are a pervasive, chronic phenomenon among truck drivers. Truck drivers themselves have a poor opinion of the paper logbooks – Record of Duty Status (RODS) – that current FMCSA regulation requires them to maintain if they are operating outside a 100 air miles radius from their work reporting location. Often referred to as “comic books,” many truck drivers regularly violate hours of service working time, driving time, and minimum rest time limits and falsify the entries on their paper logbooks. Seasoned drivers also know how to create a paper trail of accessory documents, often demanded by motor carrier enforcement personnel conducting compliance reviews, that just happen to support, or at least not to contradict, the entries in the log books. I use the plural here of “log books” not just to refer to all the RODS maintained by interstate truck drivers, but also the two and sometimes three different log books maintained by just one driver: one that really memorializes hours of service, one for enforcement officials, and yet another for the motor carrier the driver works for.

But despite widespread violation of even the excessive working and driving hours of the current hours of service regulation, FMCSA, in its recent rulemaking proposal, will not abate this epidemic of abuse. 72 FR 2340 (Jan. 18, 2007). The agency disregards all previous research and survey literature on the pervasive violation of hours of service regulation and, instead, argues that EOBRs should be required only for the “worst offenders.” These “worst offenders” are those who are detected in compliance reviews as having at least 10 percent of their drivers found to have violated hours of service and then, within another two years, at least 10 percent are found again in a subsequent compliance review to have violated the regulation. Only then would the agency impose a requirement to install and use EOBRs to record driving time.

Please note that this is the agency that conducts only 7,000 to 11,000 compliance reviews each year out of more 700,000 registered motor carriers, an effort, as I have already pointed out, that amounts to about 1.5 percent compliance reviews each year. This is the agency that has just submitted a budget request to Congress stating that it

intends to conduct only 10,000 compliance reviews in both FY2007 and FY2008. This is the agency that states in its EOBR rulemaking proposal that it forecasts about **465 motor carriers each year would be required to install EOBRs**. Out of the largest figure of registered motor carriers that we have heard – cited as more than 900,000 by NTSB staff on February 21, 2007, during the NTSB hearing on the Hurricane Rita motorcoach catastrophe – this amounts to **five one-hundredths of one percent – 0.05% – of registered motor carriers**. Even if I were to use the lower, published figure from FMCSA on the number of registered motor carriers – about 702,000 – the percentage of motor carriers required to use EOBRs would be **six one-hundredths of one percent – 0.06%**.

This proposed rule is so utterly ludicrous, so contemptuous of the need to curtail the epidemic of drivers falsifying their log books so they can drive until they literally fall asleep at the wheel, that FMCSA even has the gall in the preamble to argue that it could not find any health benefits for drivers using EOBRs and, therefore, for driving within the legal limits of the current hours of service rule. But this is also in keeping with an agency that repeatedly denies that it could find any adverse health impacts from having dramatically increased the amounts of driving and working time each week for commercial drivers in its 2003 and 2005 final rules amending the hours of service regulation.

If DOT argues that, without EOBRs, it can ensure that long-haul trucks from Mexico will not violate hours of service limits, then it is deceiving the American people. The use of EOBRs in any cross-border long-haul operations by Mexico-domiciled motor carriers must be mandated. Without EOBRs, the risk of crashes from sleep-deprived, exhausted drivers of Mexico-domiciled trucks will be large and will grow.

Compliance of Trucks and Buses Built in Mexico with the Federal Motor Vehicle Safety Standards is Still Unresolved.

Finally, the issue of certification of compliance of trucks with the Federal Motor Vehicle Safety Standards (FMVSS) remains a real safety problem. Federal law requires that vehicles entering the U.S. market must comply with all safety standards that were applicable in the year of their manufacture. FMCSA acknowledges that this requirement pertains to commercial vehicles manufactured in Mexico and driven into the U.S. to engage in commerce. The agency also acknowledges that few commercial vehicles built in Mexico prior to 1996 were built to U.S. safety standards and that even since 1996 some unknown percentage of commercial vehicles built in Mexico does not comply. For example, according to truck manufacturer data, between five and 20 percent of the trucks produced at plants in Mexico were not equipped with antilock braking systems (and slack adjusters), even though that requirement applied to U.S. truck production since March 1, 1997. The FMCSA admits that inspectors cannot be certain if trucks built in Mexican plants comply with U.S. standards unless they have a certification label affixed to the vehicle by the manufacturer. They cannot rely on the vehicle identification number and the vehicle registration alone. This means that trucks and buses that do not comply with U.S. standards and thus could not be sold in the U.S. could be driven into the U.S. to engage in commerce and the carriage of passengers by Mexico-domiciled companies.

This situation creates both a safety concern and an uneven playing field for U.S. manufacturers and motor carriers.

IX. What Happens When The Pilot Program Ends: Open Border Includes Free Passage for CAFTA Trucks.

During her Senate Appropriations testimony Secretary Peters was asked what will take place once the pilot program finishes after 12 months. The Secretary gave no definitive response. It is clear from the way the pilot program has been foisted on the public that once the program ends, the border opens. This is also apparent from the terms of the official “Record of Discussion” document, signed by officials of both Mexico and the U.S., that outlined the pilot program and apparently viewed it as a stepping stone to full cross-border trucking. Statement of Chairman Patty Murray (D-Wash), Hearing on Cross-border Trucking with Mexico, p. 3.

Aside from the unresolved issues of motorcoach and hazardous materials transportation across the U.S. border, another looming problem on long-haul non-U.S. trucking operations in the U.S. is the growing presence of non-North American bus and trucking companies in the U.S. conducting long-haul operations. This issue has been addressed under the Central American Free Trade Agreement (CAFTA) that was ratified by Congress in 2005. Unlike Mexico-domiciled long-haul trucking in the U.S., Central American long-haul truck and bus companies are not subject to any of the restrictions and requirements of Section 350. In fact, FMCSA plans on determining whether they comply with all of the U.S. safety standards, regulations, and law by simply asking each company to sign off on a certification statement. 71 FR 76730 (Dec. 21, 2007). There will be no pre-authorization safety audits as are required in Section 350 for awarding probationary operating authority, for example. The agency will only perform a paper review for awarding operating authority, although FMCSA promises that it will conduct a compliance review within 6-12 months of registering each CAFTA motor carrier and awarding operating authority, and within three months for any existing CAFTA motor carrier already operating in the U.S. This implies, of course, that the carriers already operating throughout the U.S. have never had compliance reviews.

Another issue concerning non-North American motor carriers operating nationwide in the U.S. is FMCSA’s statement that it will require them to use only drivers with valid commercial driver licenses and to have those drivers subjected to U.S. drug and alcohol testing. This makes it apparent that, to date, these drivers have not necessarily had valid commercial licenses or drug and alcohol testing. It also begs the question of what is meant by a “valid commercial driver’s license.” There is a Memorandum of Understanding (MOU) between the U.S. and Mexico adopted 15 years ago that recognizes the Licencia Federal de Conductor as equivalent to the U.S. CDL. One of the many objections to the original U.S.-Mexico MOU was its after-the-fact publication even though many safety organizations did not agree that the Licencia Federal de Conductor is equivalent in quality to the U.S. CDL. I am unaware of any separate agreements formally recognizing the commercial license of each individual CAFTA signatory.

In the preamble of the cited rulemaking action, FMCSA also points out that there are already many illegal motor carrier operations conducted in the U.S. by citizens of Central American nations who drive or fly into the U.S., buy a commercial motor vehicle, and then drive it through the U.S., down across our southern border, through Mexico, and into one of the Central American countries. These vehicles and their drivers have no legal operating authority, no valid commercial driver licenses, no insurance, and their vehicles may not comply with U.S. safety standards. To address this problem, FMCSA states that it will “educate” southbound non-North American motor carriers and later conduct “periodic strike forces” at the southern border to target non-registered southbound non-North American commercial motor vehicles. The vehicles and their drivers/owners will receive roadside inspection citations and sometimes will be placed OOS.

This is an irresponsible stance that threatens safety because it turns a blind eye towards the operation of commercial motor vehicles and drivers who are illegally operating trucks and buses in interstate movement and violating numerous federal laws and regulations. Why aren’t these illegal vehicles and drivers being stopped from operating in the states before they impact highway safety with crashes, deaths, and injuries? Why is FMCSA allowing these vehicles to travel hundreds, perhaps thousands of miles before they are intercepted at the southern border? Why is the primary response an inspection and only *sometimes* putting them out of service? If the vehicle and driver are operating dangerously, why would FMCSA send them into Mexico to reach a Central American country, thereby endangering citizens in other countries to the south of the U.S.? Isn’t this the agency just washing its hands of an illegal, perhaps dangerous vehicle and driver operating in the U.S.?

These and other questions about CAFTA commercial motor vehicle long-haul operations in the U.S. need to be examined and answered before the southern border is fully open to all commercial motor vehicles from Mexico and Central America.

X. Any Pilot Program Permitting Mexico-Domiciled Motor Carriers to Operate Nationwide Must Comply with Section 4007 of TEA-21.

In light of the many serious safety, legal and oversight concerns that continue to raise red flags and provide clear warnings against even a limited opening of the Southern border, I firmly believe that the proposed pilot program cannot proceed.

If and when such a pilot program becomes appropriate, Congress has already determined the basic requirements that must apply to protect public safety. As mentioned at the start of this testimony, Section 4007 of TEA-21 established the template for all pilot programs conducted by DOT. 49 U.S.C. § 31315(c). Section 4007 was enacted at the specific request of DOT, which sought authority to conduct pilot programs to evaluate alternatives to existing regulations and “innovative approaches to motor carrier, commercial motor vehicle, and driver safety.” The announced border pilot program fits squarely within this description and must be governed by the requirements of that law.

Section 4007 requires that, at the outset, the Secretary must provide public notice and seek public comment on the proposed contours of the program and the merits of the trial. In order to proceed, the Secretary must then make a determination, based on the totality of information and evidence, that the safety measures in the pilot program are designed to achieve an equal or greater level of safety than would be the case if there was no program. That is, DOT must make a showing that convincingly demonstrates that the pilot program approach can achieve the same or better level of safety than the *status quo*. At that point, if the pilot program is to take effect, it must include several defining features:

- A scheduled life of no more than three years;
- A specific data collection and safety analysis plan that identifies a method for comparison and a reasonable number of participants necessary to yield statistically valid findings;
- An oversight plan to ensure that participants comply with the terms and conditions of participation;
- Adequate countermeasures to protect the health and safety of study participants and the general public; and
- A plan to inform the states and the public about the program and to identify the participants both to safety compliance and enforcement personnel and to the public.

A specific data collection and safety analysis plan identifying a method for comparison and having sufficient statistical power from which to draw inferences has been the Achilles heel of previous FMCSA pilot program efforts. None of the previously proposed pilot programs were studies that would have survived peer review in the scientific community because they included poor data gathering protocols, lacked controlled comparison groups for gauging the safety impact of the pilot programs, failed to control the numerous confounders of field experiments and generated insufficient statistical strength to draw inferences. FMCSA has a failed record of conducting scientifically sound and useful pilot studies.

In fact, FMCSA does not conduct pilot programs just for determining their safety effects. The programs are chosen to buttress policy preferences that the agency already has formed. Pilot programs conducted in the past by FMCSA have not been chosen to test “innovative approaches” to motor carrier safety or to evaluate whether some relaxation of portions of the Federal Motor Carrier Safety Regulations produces an equivalent or better safety result than compliance. Instead, these efforts have been geared in each instance to provide regulatory relief to a sector of the trucking industry or to foster trucking “productivity,” not improve safety. In constructing pilot programs, FMCSA handpicks the very best participants to ensure that the outcome of the trial will justify a policy choice that the agency already wants to advance. Pilot programs promoted by the agency are not scientific efforts to obtain objective information, but show trials conducted to provide cover for a preconceived policy choice.

Pilot programs cause great concern in the safety community because they are experiments with the public serving as guinea pigs on our highways. Although Section 4007 directs that there must be adequate countermeasures adopted to ensure the health and safety of both pilot program participants and the general public, there are no assurances that relaxing regulatory requirements or testing "innovative approaches" to motor carrier safety might not result in terrible tragedies. For this reason, it is imperative that the Committee take extra precautions, beyond the requirements in Section 4007, to ensure safety is the highest priority in the conduct of this pilot program. The Committee should, therefore, take the following steps:

- Ensure that DOT complies with Section 4007 in carrying out any pilot program;
- Require DOT to specify, as part of the detailed description of the pilot program submitted for public comment, the criteria it will use in exercising its authority to revoke participation in the program under Section 4007(c)(3);
- Require that the National Transportation Safety Board (NTSB) investigate every crash by a participating motor carrier, vehicle and driver that involves a fatality or injury;
- Require DOT to specify, as part of the detailed description of the pilot program submitted for public comment, the criteria it will use in exercising its authority to terminate the program under Section 4007 (c)(4); and,
- Require DOT to submit bimonthly reports to Congress on the pilot program including data on all crashes, fatalities, injuries, violations and out of service orders.

Thank you for this opportunity to voice our deep concerns over this initiative. I am happy to answer any questions you may have.
